## 1 ABSTRACT

- 2 A method for preparing carpet by using polyurethane foam to
- 3 anneal secondary backing to a greige, comprising fibers attached
- 4 to a primary backing. The polyurethane monomers are mixed just
- 5 prior to application to the greige primary backing allowing the
- 6 relatively low viscosity polyurethane to penetrate the fibers of
- 7 the primary backing to aid in fiber lock. The polyurethane
- 8 coated greige is then contacted with the secondary backing
- 9 before complete polymerization to insure sufficient tack to hold
- 10 the backings together. Sufficient water is applied through
- 11 application of steam after the polyurethane components are
- 12 applied to the greige to completely cure the polyurethane
- 13 without a curing oven.
